

BIODIVERSITY

Biodiversity is the variety of all living things, like plants, animals, and tiny microbes, that live in our environment.

In Australia, biodiversity is very special because we have many unique species that aren't found anywhere else in the world, like koalas, platypuses, and kangaroos.

Plants and animals all work together to keep our ecosystems healthy — they clean our air and water, help the environment grow, and provide food and shelter for each other.

Protecting biodiversity helps keep our planet balanced, lets humans live healthily.

Improving biodiversity makes sure future generations can enjoy Australia's amazing wildlife and natural places.
